GB

Do not use alcohol, solvents, or hard brushes.
Do not let water or other liquids get inside the machine.

Per pulire la macchina, utilizzare aria compressa o un panno morbido, dato che il pannello del touch si graffia molto facilmente. Prima di ogni operazione, scollegare il cavo di alimentazione elettrica dalla presa di rete.

I

Non utilizzare alcol, solventi o spazzole dure.
Assicurarsi che acqua o altri liquidi non penetrino all'interno della stampante..

Pour nettoyer la machine, utiliser un système pneumatique ou un chiffon souple. Avant d'effectuer toute opération, débrancher la câble de l'alimentation électrique de la prise de réseau.

F

Ne pas utiliser de l'alcool, des solvants, ni des brosses dures.
Vous assurer que ni l'eau ni aucun autre liquide ne pénètrent dans l'imprimante.

Zum Reinigen der Maschine einen Pressluft oder einen weichen Lappen benutzen. Zuersten den Hauptstecker aus der Netzsteckdose ziehen.

D

Keinen Alkohol, Lösungsmittel oder harte Bürsten verwenden.
Darauf achten, dass kein Wasser oder andere Flüssigkeiten in die Maschine eindringen.

Para limpiar la máquina, utilice una neumatica o un paño suave. Antes de cualquier operación, desconecte el cable de alimentación eléctrica de la toma de red.

PIXEL DEFECT CRITERIA FOR LCD TOUCH SCREEN:

The display may have cosmetic imperfections that appear as small bright or dark spots. This is common to all LCD displays used in products supplied by all vendors. These imperfections are caused by one or more defective pixels or sub-pixels.

A pixel is composed of three sub pixels, one red, one green, and one blue. Individual defective sub pixel control circuits can cause the corresponding sub pixel to be permanently lit (red, green or blue bright dot) or may not light at all (dark dot). This is classed as a Defect Pixel.

INSPECTION CRITERIA

Dot Defect	
> Bright Dot: Dots(sub-pixels) which appeared brightly in the screen when the LCM displayed with dark pattern.	
R, G or B 1 dot	4 Max
Adjacent 2 dots	1 Max
Total amount of Bright dots	4 Max
Minimum Distance between bright dots	Within 20 mm, Max 2
> Dark Dot: Dots(sub-pixels) which appeared darkly in the screen when the LCM displayed with bright pattern.	
1 dot	4 Max
Adjacent 2 dots	1 Max
Total amount of Dark dot	4 Max
Minimum Distance between dark dots	Within 20 mm, Max 2
> Total amount of Dot Defects	8 Max(Combination)
Note:	a) Every dot herein means Sub-Pixel (Each Red, Green, or Blue Color) b) Bright & Dark dots are larger than half sub-pixel. (Dots smaller than half sub-pixel are not counted as a defect dots.)

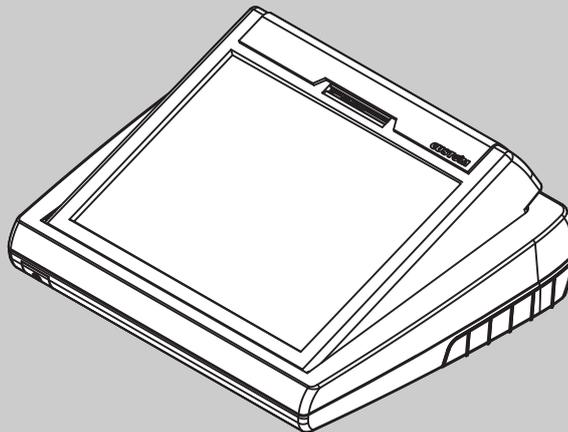

I POLITICA DEI DIFETTI DEI PIXEL PER LCD A SCHERMO ATTIVO:

Tutti i display a cristalli liquidi (liquid crystal display - LCD) contengono milioni di singoli pixel e per questo motivo i difetti dei pixel e dei subpixel nei pannelli LCD sono talvolta inevitabili. Nessun produttore è in grado di garantire che tutti i pannelli siano privi di difetti dei pixel.

Ogni pixel è formato da tre sub-pixel di colore rosso, blu e verde. I difetti dovuti a punti luminosi appaiono quando alcuni pixel o subpixel restano sempre illuminati o "accesi" (i tre subpixel colorati appaiono insieme come un singolo pixel bianco) oppure quando sono sempre scuri o 'inattivi', (i tre subpixel colorati appaiono insieme come un pixel nero). Questo definisce il tipo di difetto del pixel.

MODALITÀ DI VALUTAZIONE

Difetto del punto	
> Punti Luminosi: Pixel(sub-pixels) che risultano evidenziati sullo schermo quando il monitor visualizza un motivo scuro.	
1 punto (sub-pixels rosso, verde o blu)	4 Max
2 punti adiacenti	1 Max
Totale punti luminosi	4 Max
Distanza minima tra punti luminosi	Entro 20 mm, Max 2
> Punti Neri: Pixel (sub-pixels) che compaiono sempre scuri o 'inattivi' quando il monitor visualizza un motivo chiaro.	
1 punto	4 Max
2 punti adiacenti	1 Max
Totale punti neri	4 Max
Distanza minima tra punti neri	Entro 20 mm, Max 2
> Difettosità totale relativa a punti luminosi o neri di qualsiasi tipo	8 Max (Combinati)
Note:	a) Per punto si intende sub-pixel (ciascun sub-pixels di colore rosso, verde o blu) b) Punti luminosi e scuri sono più larghi di mezzo sub-pixel. (Punti più piccoli di mezzo sub-pixel non sono considerati come punti difettosi.)
